

## **Bright X-ray bursts from 1E1724-3045 in Terzan 2**

M. Cocchi, A. Bazzano, L. Natalucci, P. Ubertini (IAS/CNR), J. Heise, E. Kuulkers, J.J.M. in t Zand (SRON)

During about 3 years 2-28 keV monitoring of the Galactic Centre region by the Wide Field Camera telescopes on board the *BeppoSAX* satellite, a total of 14 type-I X-ray bursts were detected from the hard tailed burster 1E 1724-3045 located in the globular cluster Terzan 2. All the observed events showed evidence of photospheric radius expansion due to near-Eddington burst luminosity, thus leading to an estimate of the source distance ( $\sim 7.2$  kpc). Preliminary results of the analysis of the bursts are presented.
