

Millimeter-wave behaviour of EGRET-detected and non-EGRET-detected AGNs

Merja Tornikoski, Anne Lähteenmäki (Metsähovi Radio Observatory)

We discuss the millimeter-wave radio behaviour of a selected sample of southern and equatorial AGNs that have been in the EGRET field of view during the CGRO Cycles 1-4 (as listed in the Third EGRET source catalog).

We have studied some of the best sampled radio flux curves in detail and have analysed the structure of their radio flares. We discuss possible explanations to why some AGNs that are bright and highly variable in the radio domain have not been detected with the EGRET.
