X-ray Observations of the EGRET Sources 3EG 2016+3657 and 3EG 2021+3719

Reshmi Mukherjee (Barnard College, Columbia University), Eric Gotthelf (Columbia University), Dana Stern (Barnard College), Marco Tavani (IFCTR, Milan)

The Third EGRET Catalog (Hartman et al. 1999) lists 271 sources of high energy ($E > 100$ MeV) gamma-rays of which 169 are unidentified. The origin of these unidentified sources, both in the Galactic plane, as well as at high latitudes, remain a perplexing mystery for high energy astrophysics. In this poster we present a study of two unidentified sources 3EG 2016+3657 and 3EG 2021+3719, located close to the COS B source 2CG 075+00. We summarize the x-ray and gamma-ray observations around the error boxes of the sources to search for clues on the nature of these objects.
